Enrolment number : 20230905090513

Name : Ved Kankotiya

Branch : IT

Students will develop a Flutter application with local data storage using SQLite, Hive, or SharedPreferences, demonstrating storing, retrieving, and updating data. They must upload the project code on GitHub along with proper documentation/manual in PDF format explaining the project workflow. This ALA is to be completed individually. Students will submit the GitHub repository link and PDF documentation on the GMIU Web Portal.

A simple notes storing flutter application using shared preferences.

GITHUB: https://github.com/VK21225/flutter_fad_ala_3

Project Description

The **Notes CRUD Application** is a simple mobile application developed using **Flutter** that allows users to create and manage personal notes. The application demonstrates the implementation of **local data storage** using **SharedPreferences**.

The main objective of this application is to perform **CRUD (Create, Read, Update, Delete) operations** on notes while maintaining a clean and user-friendly interface. Users can enter a **title and description** for each note using input fields provided at the top of the application.

When the user adds a note, the data is stored locally on the device using `SharedPreferences`. The application retrieves the stored notes whenever it is opened and displays them in a structured list format using card-based UI elements.

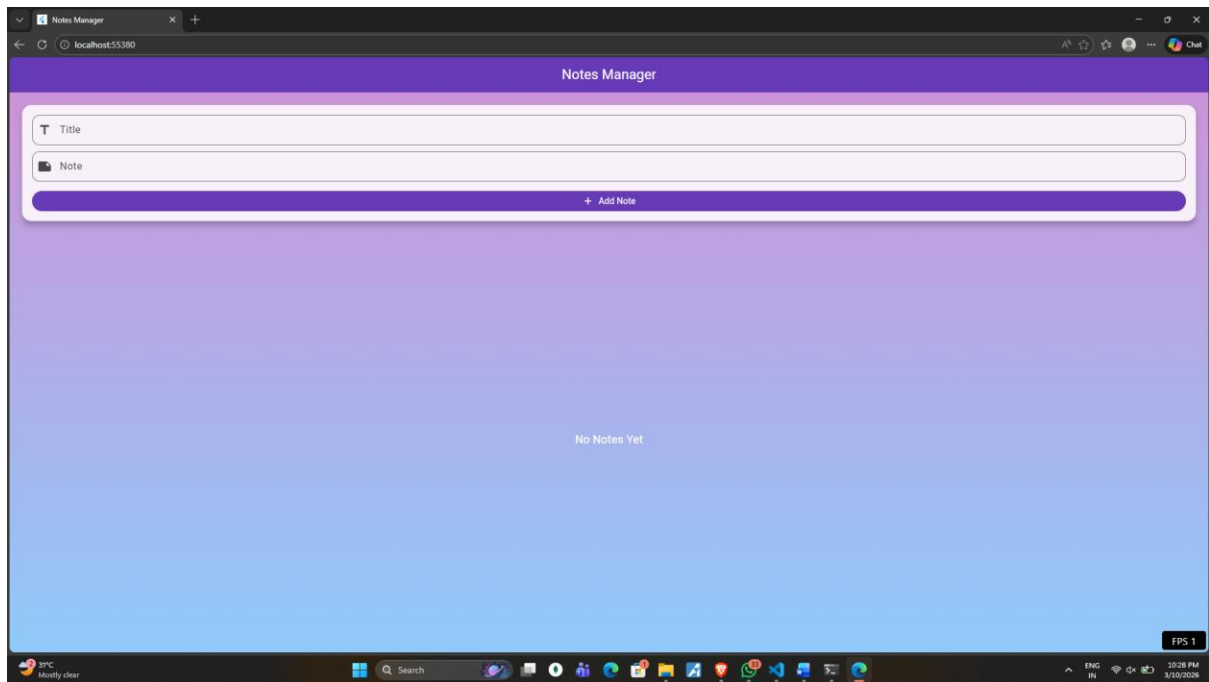

Users can also **edit existing notes** by selecting them from the list, which opens an editing dialog allowing the content to be updated. Additionally, notes can be **deleted** using the delete option provided for each note.

The application workflow ensures that all notes are saved persistently so that the data remains available even after the application is closed and reopened. This project demonstrates the practical use of Flutter for developing user interfaces and managing local data storage efficiently.

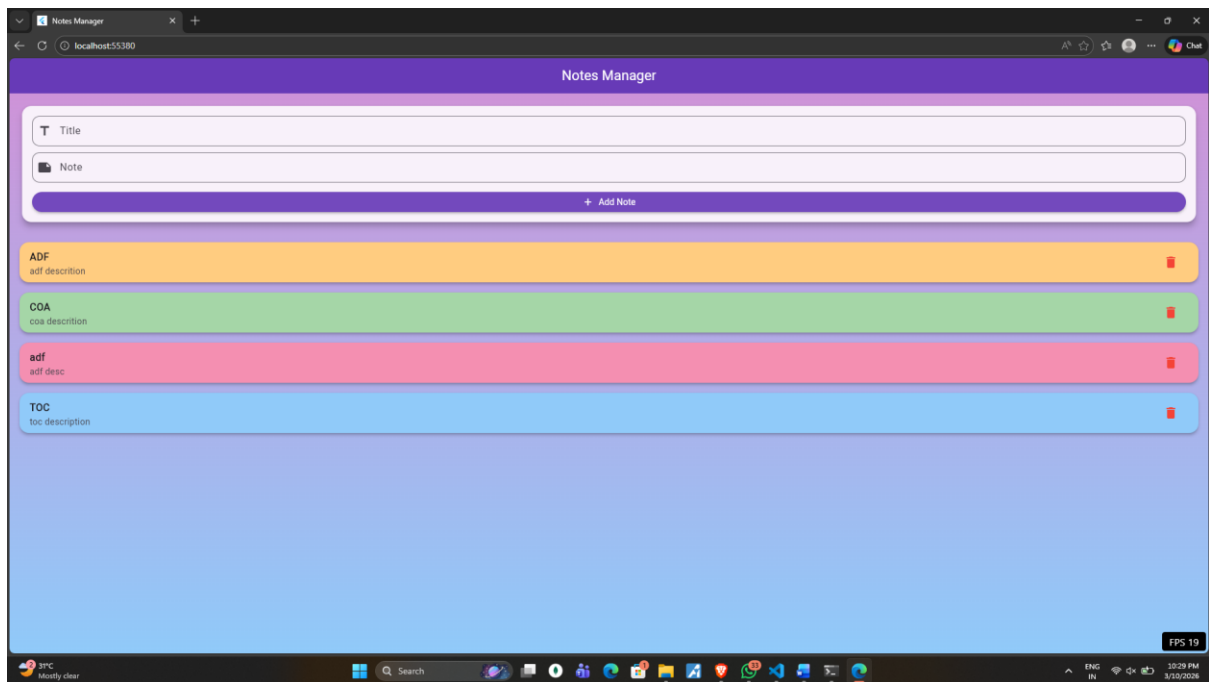

Overall, the project provides a simple yet effective example of how mobile applications can handle **data storage, retrieval, and modification** using Flutter and `SharedPreferences`.
